                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to isolated polynucleotide (I) and polypeptide (II) C sequences. (I) is useful as hybridisation probes, polymerase chain CC reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal cuseful for generating antibodies against it, detecting or quantitating a CC useful for generating antibodies against it, detecting or quantitating a CC polypeptide in tissue, as molecular weight markers and as a food CC supplement. (II) and its binding partners are useful in medical imaging CC of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The CC diagnostics, forensics, gene mapping, identification of mutations CC responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and CC and no acid sequences. AAS64197-AAS94564 represent novel human diagnostic patent did not appear in the printed specification, but was obtained in CC electronic format directly from WIPO at the content of the product of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess

Claim 1; SEQ ID NO 625; 103pp; English

cc genes. (I) is useful in gene therapy techniques to restore normal cc genes. (I) is useful in gene therapy techniques to restore normal cc useful for generating antibodies against it, detecting or quantitating a cc useful for generating antibodies against it, detecting or quantitating a cc golypeptide in tissue, as molecular weight markers and as a food cc golypeptide in tissue, as molecular weight markers and as a food cc sites expressing (II). (I) and (II) are useful in medical imaging co f sites expressing (II). (I) and (II) are useful for treating disorders cinvolving abservant protein expression or biological activity. The cc polypeptide and polynucleotide sequences have applications in cc diagnostics, forensics, gene mapping, identification of mutations cc diagnostics, forensics, gene mapping, identification of mutations cc and to produce other types of data and products dependent on DNA and camino acid sequences. AAS64197-AAS94564 represent novel human diagnostic coding sequences of the invention. Note: The sequence data for this cc coding sequences of the invention. Note: The sequence data for this cc patent did not appear in the printed specification, but was obtained in ce lectronic format directly from WIPO at The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed in diagnostics as expressed sequence tags for identifying expressed ftp.wipo.int/pub/published_pct_sequences

New ovary specific genes and proteins, useful as a vaccine for patients with ovarian cancer, or for diagnosing and monitoring presence and metastases of ovarian cancer in a patient. treating

Claim 1; Page 173; 260pp; English.

ABN87790 to ABN87882 represent human ovary specific nucleic acid (OSNA) sequences, and ABB79297 to ABB79370 represent ovary specific protein (OSP) sequences from the present invention. OSNA and OSP sequences have cytostatic activity, and can be used in vaccine production and gene therapy. An antibody that specifically binds to an OSP can be used for treating a patient with ovarian cancer, particularly for inducing an immune response against the ovarian cancer cell expressing the OSNA or OSP. The OSNAs and OSPs can also be used for diagnosing and monitoring the presence and metastases of ovarian cancer in a patient

                                                                                                                                                                                                                                                                                                The present invention relates to human single exon nucleic acid probes (SENP). The present sequence is one such probe. The SENPs are derived from human HeLa cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cancer. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at itp.wipo.int/pub/published_pct_sequences

/note="Organ: lung; Vector: pOTB7; Site 1: XhoI; Site 2: ECCRI; cDNA made by Oligo-dT priming. Directionally cloned into EccRI/XhoI sites using the following 5' adaptor: GGCACGAG(G). Library constructed by Ling Hong in the laboratory of Gerald M. Rubin (University of California, Berkeley) using ZAP-cDNA synthesis kit (Stratagene) and Superscript I RT (Life Technologies). Note: this is a NIH_MGC Library."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from pools of 5,000 clones made from the same 3 libraries. The pools consisted of I.M.A.G.E. clones 260232-265223, 340488-345479, and 484488-489479.

/note="Organ: lung; Vector: pT773D-Pac (Pharmacia) with a modified polylinker; Plasmid DNA from the normalized library NCI CGAP Lu5 was prepared, and ss circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from a pool of 5,000 clones made from the same library (cloneIDs 141420-14179) and 1520904-1522439). Subtraction by Bento contents the same library (cloneIDs

```

	following tissue(s): RPE and Choroid. The library was constructed according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. First strand cDNA, synthesis was primed with an oligo-dT primer containing a Not I site. Double stranded cDNA was ligated to an EcoR I adaptor, digested with Not I, and cloned directionally into pTT3-Pac vector. The oligonuclectide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT)18 tail. The sequence tag for this library is ACCTA. This library was created for the program, Gene Discovery in the Visual System, supported by National Eye Institute TAG_INSUE_RPE and Choroid TAG_LE=UI_E_CI1 TAG_SEQ=ACCTA"

New ovary specific genes and proteins, useful as a vaccine for treating patients with ovarian cancer, or for diagnosing and monitoring the presence and metastases of ovarian cancer in a patient.

Claim 11; Page 241; 260pp; English.

ABN87790 to ABN87882 represent human ovary specific nucleic acid (OSNA) sequences, and ABB79297 to ABB79370 represent ovary specific protein (OSP) sequences from the present invention. OSNA and OSP sequences have cytostatic activity, and can be used in vaccine production and gene therapy. An antibody that specifically binds to an OSP can be used for treating a patient with ovarian cancer, particularly for inducing an immune response against the ovarian cancer cell expressing the OSNA or OSP. The OSNAs and OSPs can also be used for diagnosing and monitoring the presence and metastases of ovarian cancer in a patient

                                                                           The invention relates to a new isolated nucleic acid termed ovarian specific nucleic acid (OSNA) comprising: (a) a nucleic acid molecule that encodes any of 53 fully defined protein sequences appearing as ABU61018-ABU61070 (termed ovarian specific proteins, OSP); (b) any of 76 fully defined nucleotide sequences appearing as ABS92187-ABS92262; or (c) a sequence having at least 60% sequence identity to the nucleic acid molecule of (a) or (b). Also included are a method for determining the presence of an ovary specific nucleic acid (OSNA) in a sample, a vector comprising an OSNA, a host cell comprising the vector, an isolated OSP polypeptide, an anti-OSP antibody or fragment, a method for determining the presence of an ovary specific protein in a sample and a vaccine comprising an OSP or OSNA. The methods and compositions of the present invention are useful for identifying, diagnosing, monitoring, staging, imaging and treating ovarian cancer and non-cancerous disease in ovary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated OSNA nucleic acid and encoded polypeptide, useful for identifying, diagnosing, monitoring, staging, imaging and treating ovarian cancer and non-cancerous diseases in ovarian tissues.

Sequence 121 AA;

The invention discloses a composition comprising two or more isolated rat cor human polynucleotides or a polynucleotide which represents a fragment, consider the constructive or allelic variation of the nucleic acid sequence. Also comprising the vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a compound that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal contracted to pain, a method for identifying an agent compound which regulates the expression of a polynucleotide sequence which is differentially expressed in neuronal tissue of a first animal compound that is differentially expressed in neuronal tissue of a first animal compound that regulates the expression of a polynucleotide sequence which is differentially compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound or small molecule that regulates the contributy in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating the specification, a method for identifying a compound useful in treating the specification, a method for identifying a compound useful in treating the specification, a method for identifying a compound useful in treating the specification, a method for identifying a compound useful in treating the specification, a method for identifying a compound useful in treating the specification, a method for identifying a compound useful in treating the specification, a method for identifying a compound useful in treating the specification, a method for identifying a compound useful in treating the specification, a method for identifying a compound useful useful in treating the specification.

New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.

Claim 1; Page; 1017pp; English.

The polypuclectide or the compound that modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (Chung), chronic constriction injury (CCI) and spared nerve injury (SNI) in an animal (e.g. gene therapy). The sequence presented is a rat protein (shown in Table 2 of the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
 The invention discloses a composition comprising two or more isolated rat or human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              cc which is differentially regulated in an animal subjected to pain and a ckit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal cc subjected to pain, a method for identifying a compound which regulates the expressed in an animal subjected to pain, a method for identifying a compound which regulates the compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composition, a cc method for identifying a compound or small molecule that regulates the cc method for identifying a compound or small molecule that regulates the cc activity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating cc pain and a pharmaceutical composition comprising the one or more compound useful in treating cc pain (e.g. spinal segmental nerve injury (cnumg), chronic constriction contriction (e.g. spinal segmental nerve injury (cnumg) a medicament for treating cc pain (e.g. spinal segmental nerve injury (cnumg). The sequence presented is a rat protein (shown in Table 2 of the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed contributed in electronic form directly from WIPO at free internal case of the part certains and internal case of the part certains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           S

                                                                                                                                                                                       CC The invention relates to an isolated protein that is one of 186 human CC secreted proteins, given in the specification, encoded by one of 309 cDNA CC sequences also given in the specification. The protein is used in a CC pharmaceutical composition used to prevent, treat or ameliorate a medical C condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, CC chickens or sheep. Disorders which are diagnosed or treated include CC autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative C disorders e.g. neoplasms of the breast or liver, cardiovascular disorders CC e.g. cardiac arrest, cerebrovascular disorders e.g. cerebral ischaemia, CC angiogenesis, nervous system disorders e.g. Alzheimer's disease, CC infections caused by bacteria, viruses and fungi and ocular disorders e.g. corneal infection. The polypeptides can also be used to aid wound CC healing and epithelial cell proliferation, to prevent skin aging due to subburn, to maintain organs before transplantation, for supporting cell CC culture of primary tissues, to regenerate tissues and in chemotaxis. The CC increase or decreese storage capabilities, fat content, lipid, protein, CC carbohydrate, vitamins, minerals, cofactors and other nutritional CC components. The present sequence represents one of the novel human CC secreted proteins of the invention

The present invention relates to the isolation of novel human secreted CC proteins and the polynucleotide sequences encoding them. The invention CC also discloses vectors, host cells, antibodies, and recombinant methods CC for producing human secreted proteins. The polypeptide and polynucleotide CC sequences for the secreted proteins are useful for preventing, treating, CC ameliorating or diagnosing medical conditions such as hyperproliferative CC disorders (e.g. leukaemia or breast cancers), wounds, reproductive CC thrombocytopaenia), immunodeficiencies (e.g. wiskott-Aldrich syndrome or CC thrombocytopaenia) autoimmune disorders (e.g. wiskott-Aldrich syndrome or CC miltiple sclerosis or Hashimoto's thyroiditis), allergies (e.g. asthma), CC viral or bacterial or fungal infections (e.g. AlDS or sepsis), renal CC disorders (e.g. kidney failure), cardiovascultar disorders (e.g. angina pectoris, cerebral ischaemia or congenital heart defects), respiratory CC disorders, neurological disorders (e.g. Alzheimer's disease or CC Parkinson's disease), and inflammations (e.g. Crohn's disease). The CC Mote: The sequence data for this patent did not form part of the printed CC specification, but was obtained in electronic format directly from the CC USPTO web site at seqdata.uspto.gov/psipsDIDEntry.html
                                                                                                                                                 Query Match

WPI; 1998-506364/43.

New isolated human genes and the secreted polypeptide(s) they encode useful for diagnosis and treatment of e.g. cancers, neurological disorders, immune diseases, inflammation or blood disorders.

Claim 1; Page 567; 721pp; English.

This sequence represents a secreted human protein encoded by the nucleic acid molecule designated Gene 48 from the human cDNA clone HFCA174 (deposited as clone ATCC 97899 and ATCC 209045). The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin Fc portion (e.g. AAV59502) for increasing the stability of the fused protein as compared to the human protein only. The invention relates to 186 novel genes and their fragments (nucleic acid sequences: AAV59511- V59812; amino acid sequences AAW74731-W75026) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein

Also, pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polypuclaotides. Specific uses are described for each of the 186 polypucleotides, based which tissues they are most highly expressed in (see AAV59511 for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; genome mapping; gene therapy; food supplement; virus; fungus; cell-proliferative disorder; neurodegenerative disease; bacterial; parkinson's disease; Alzhaimer's disease; autoimmune disease; multiple sclerosis; diabetes; genetic disorder; wound; burn; infection; arthritis; cytostatic; immunomodulator; nootropic; neuroprotective; antiparkinsonian; antidiabetic; immunosuppressive; dermatological; haemostatic; vulnerary; fungicide; antibacterial; virucide; protozoacide;

New polynucleotides comprising sequences assembled from expressed sequence tags (ESTs), useful for treating cell-proliferative, neurodegenerative, autoimmune, genetic, myeloid or lymphoid, or p coagulation disorders. platelet

Claim 9; SEQ ID NO 1042; 1012pp + Sequence Listing; English

The invention relates to an isolated polynucleotide (I) comprising a nucleotide sequence selected from any of 948 sequences (ABZ11119-ABZ12066) or their mature protein coding portion, active domain coding protein or complementary sequences. The polynucleotides are useful for identifying expressed genes or for physical mapping of human genome. The encoded polypeptides (ABP68902-ABP69849) are useful as molecular weight markers, as a food supplement, for generating antibodies, in medical imaging, screening and diagnostic assays and for treating cell-proliferative disorders (cancer), neurodegenerative diseases (Parkinson or Alzheimer's disease), autoimmune diseases (multiple sclerosis, (Parkinson's weight

preservative. New isolated human secreted protein for diagnosing, preventing, treating or ameliorating medical conditions and used as a food additive or

Example 1; SEQ ID NO 367; 129pp; English.

autonominate diseases e.g. rheumatoid arthritis, hyperproliferative consorders e.g. neoplasms of the breast or liver, cardiovascular disorders c.g. cardiac arrest, cerebrovascular disorders e.g. cerebral ischaemia, angiogenesis, nervous system disorders e.g. Alzheimer's disease, c.g. angiogenesis, nervous system disorders e.g. Alzheimer's disease, c.g. corneal infection. The polypeptides can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to increase or decrease storage capabilities, fat content, lipid, protein, carbohydrate, vitamins, minerals, cofactors and other nutritional components. The present sequence represents one of the novel human secreted proteins of the invention. Note: This sequence did not form part of the printed specification, but was obtained in electronic format directly from USPTO at seqdata.uspto.gov/sequence.html?DocID=6420526B1 The invention relates to an isolated protein that is one of 186 human secreted proteins, given in the specification, encoded by one of 309 c sequences also given in the specification. The protein is used in a pharmaceutical composition used to prevent, treat or ameliorate a medicondition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. Disorders which are diagnosed or treated include a medical CDNA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to the isolation of novel human secreted proteins and the polynucleotide sequences encoding them. The invention CC proteins and the polynucleotide sequences encoding them. The invention CC also discloses vectors, host cells, antibodies, and recombinant methods for producing human secreted proteins. The polypeptide and polynucleotide sequences for the secreted proteins are useful for preventing, treating, ameliorating or diagnosing medical conditions such as hyperproliferative disorders (e.g. leukaemia or breast cancers), wounds, reproductive conditions for preventing, treating, and thrombocytopaenia, antoimmune disorders (e.g. wiskott-Aldrich syndrome or continue thypoplassia), antoimmune disorders (e.g. wiskott-Aldrich syndrome or cultiple sclerosis or Hashimoto's thyroiditis), allergies (e.g. asthma), continue of bacterial or fungal infections (e.g. ALDS or sepsis), renal continues (e.g. kidney failure), cardiovascular disorders (e.g. anginae contents), and inflammations (e.g. Crohn's disease). The colymucleotide or polypeptide may also be used as vaccine adjuvants. CC ABO34374-ABO34815 represent human secreted proteins or their fragments. CC Exching the sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the USPPO web site at segdata.uspto.gov/psipsDIDEntry.html
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match 38.8%; Score 245; DB 6; Best Local Similarity 100.0%; Pred.
